

Co-developing rangeland ecohydrological indicators to balance livestock production and conservation in a changing climate

David L. Hoover, David P. Smith, Nicole K. Kaplan, David J. Augustine, Sean Kearney,
Lauren M. Porensky, Dannele Peck, John P. Ritten, and Justin D. Derner

International Forum on
Agroecosystem Living Labs
October 5th, 2023
Montreal, CA

Rangelands: defined by environmental characteristics (dominated by grass and/or shrubs) and land use (grazed or potential to be grazed)

Environmental
monitoring

tools

Environmental monitoring

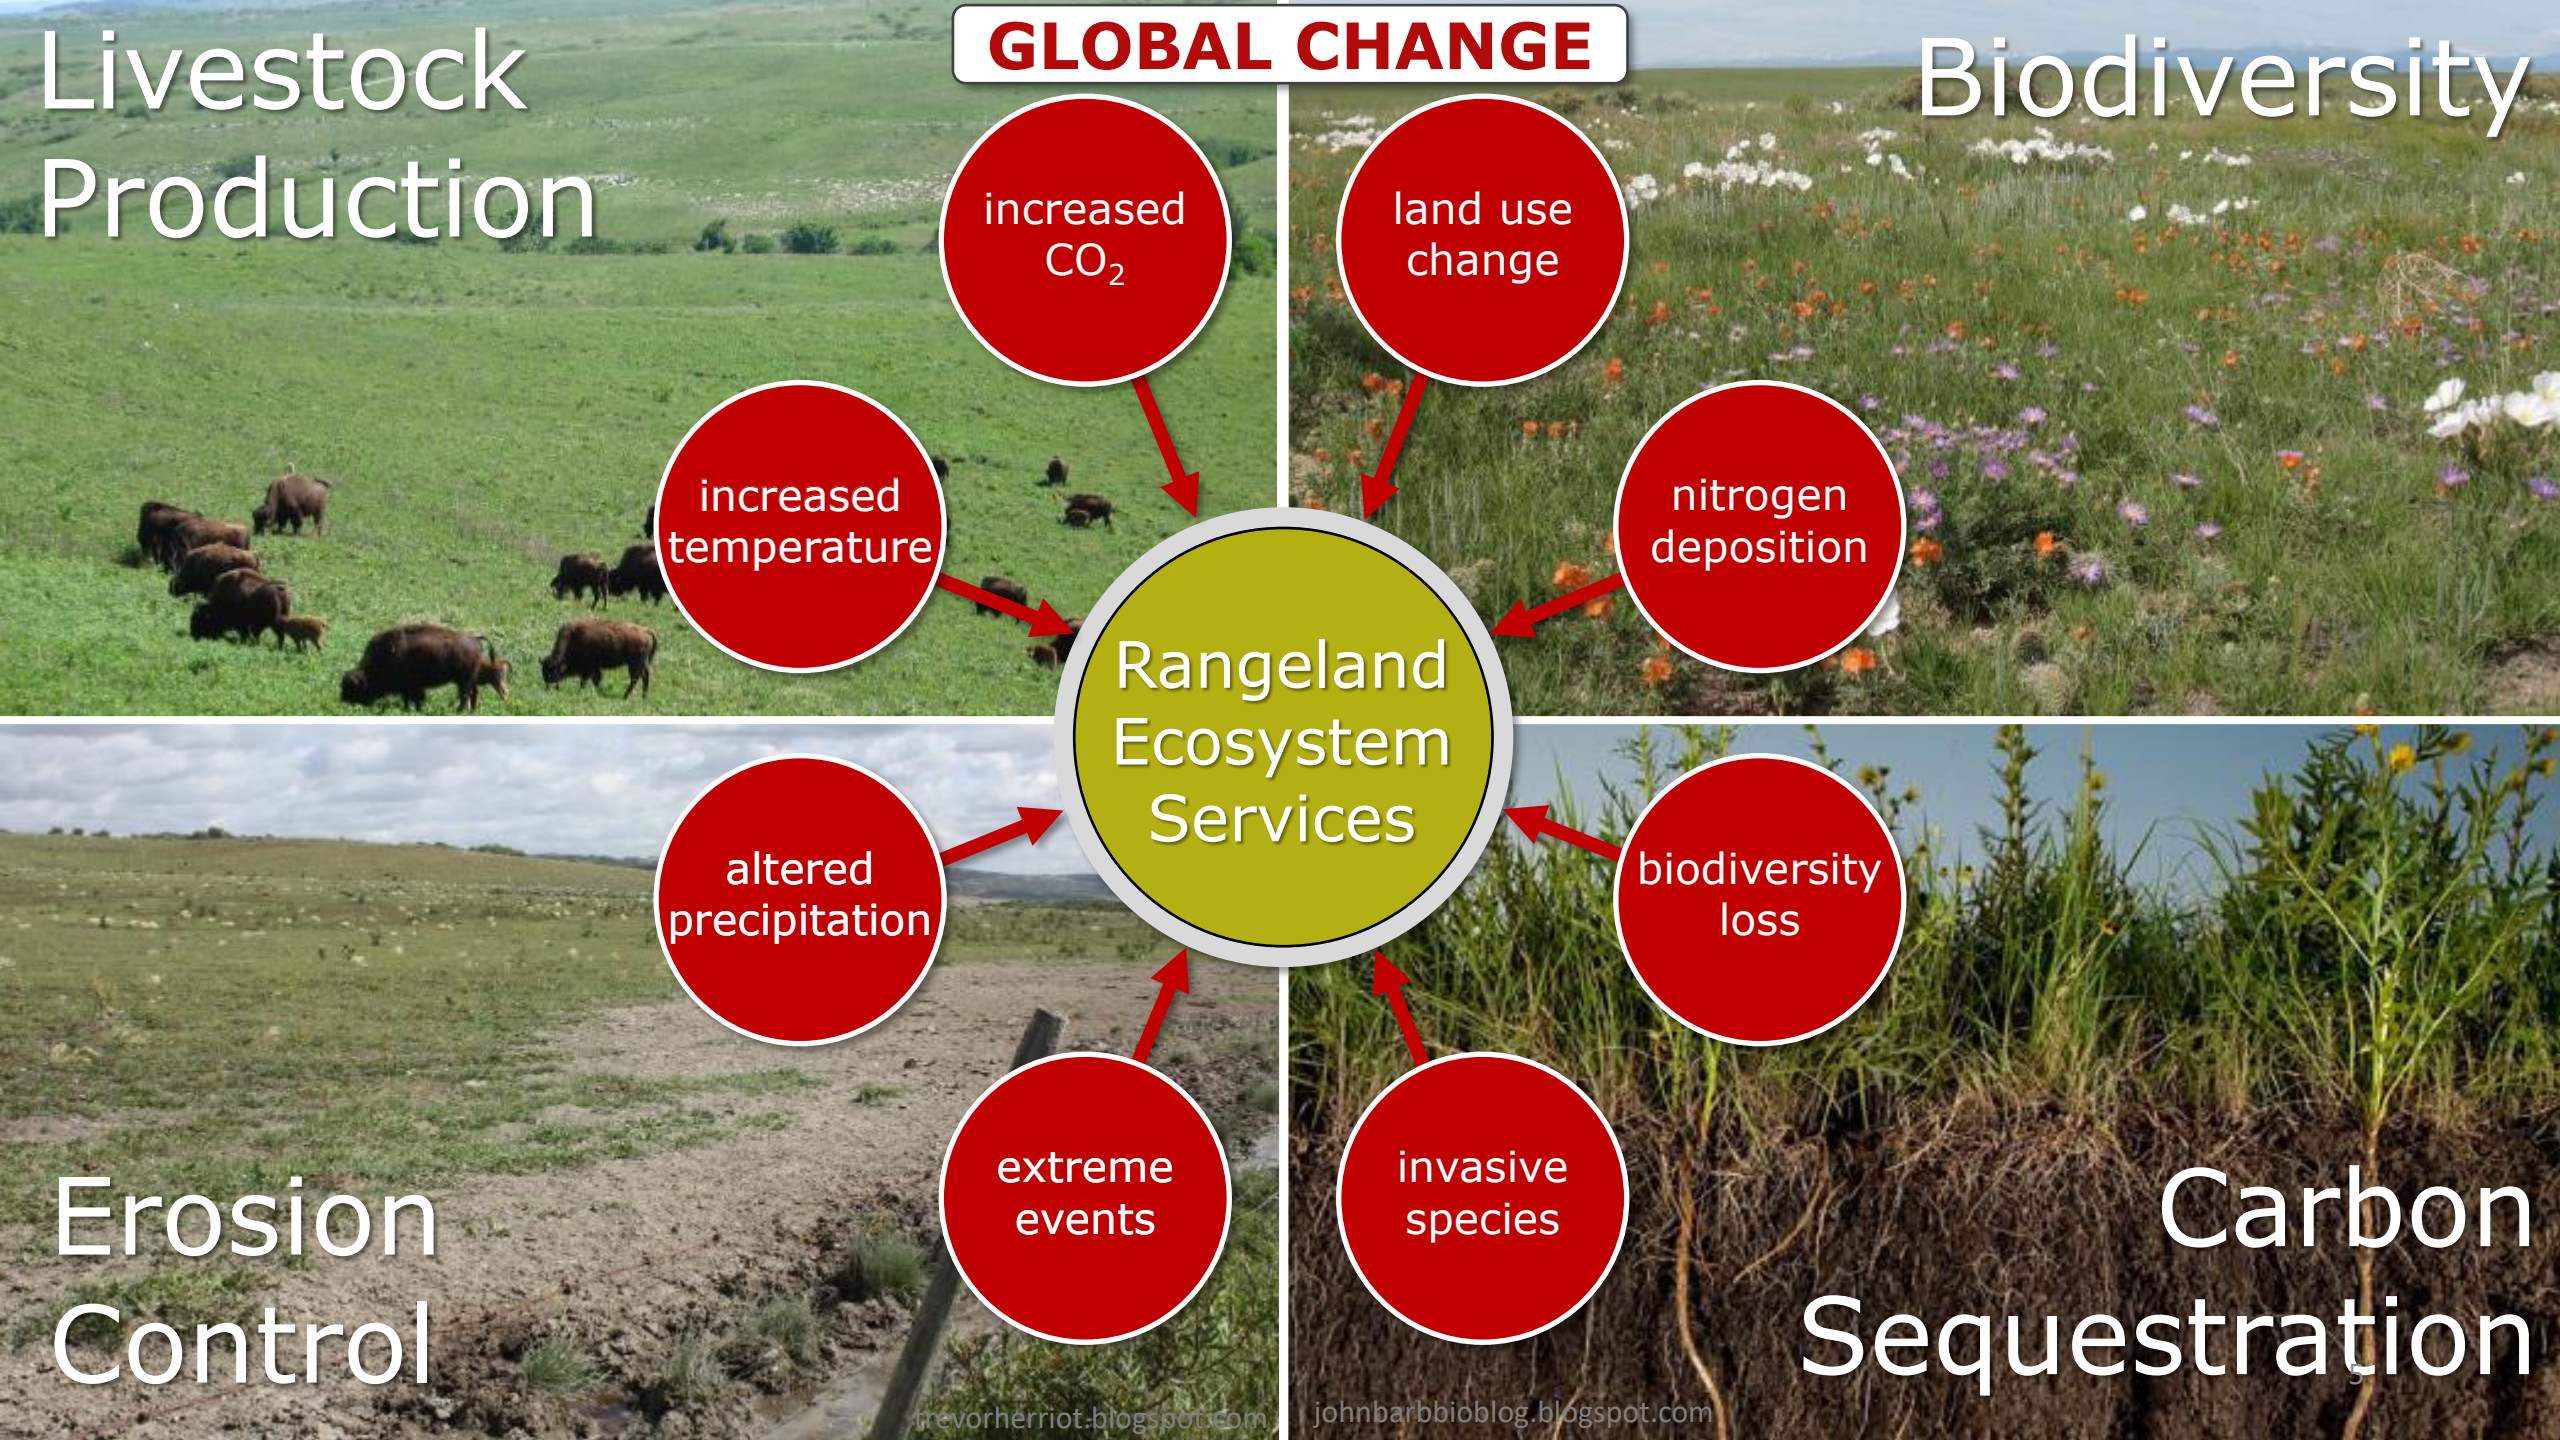

Management tools

Livestock Production

GLOBAL CHANGE

Biodiversity

Erosion Control

Carbon Sequestration

How to balance livestock production and other ecosystem services with global change?

Central Plains Experimental Range

Long Term Agroecosystem
Research network

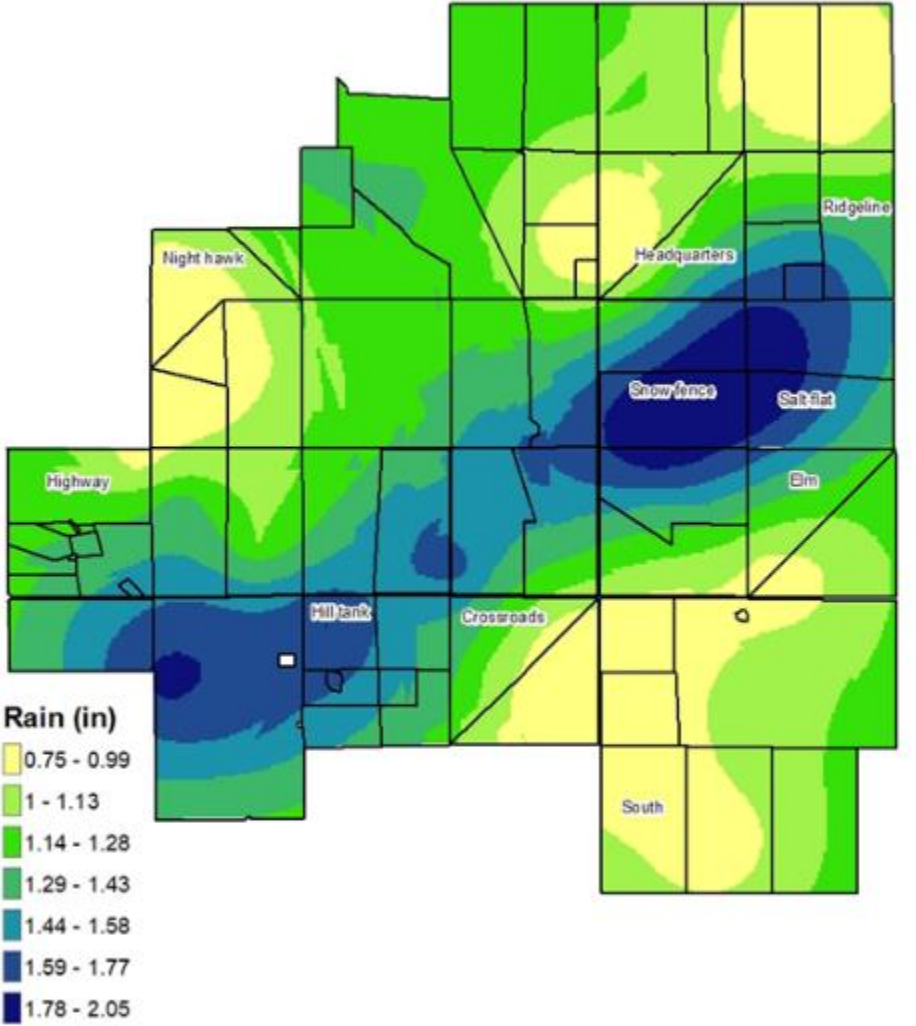

What are the **challenges** to producers and land managers?

1. Precipitation variability

Temporal variability

Spatial variability

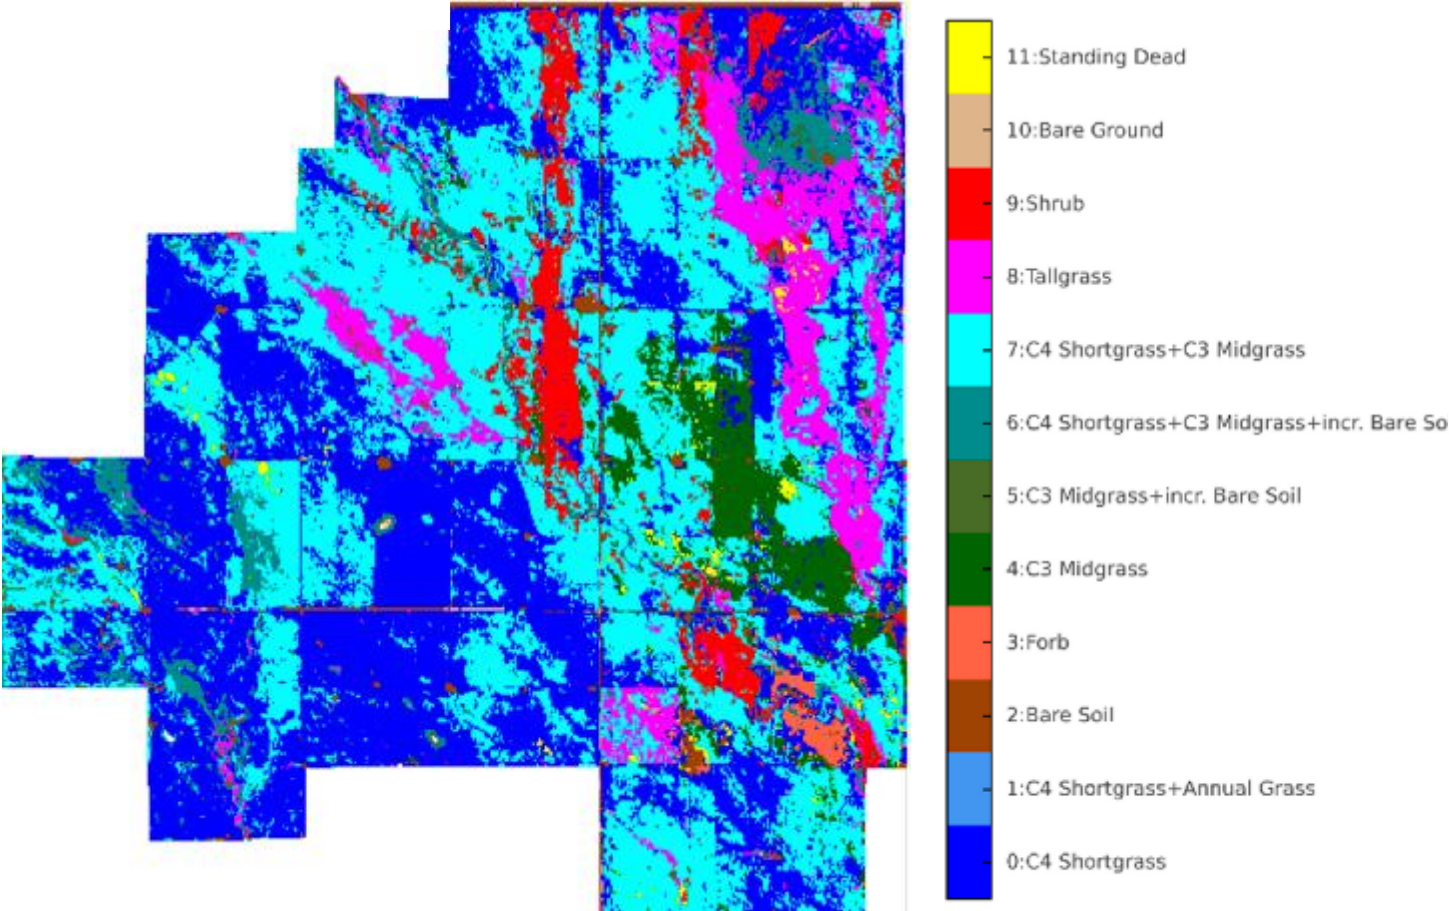

What are the **challenges** to producers and land managers?

2. Landscape heterogeneity

Plant community heterogeneity

Topoedaphic variability

1939

Stakeholders

Scientists

Stakeholder-hypothesized **management tradeoffs**

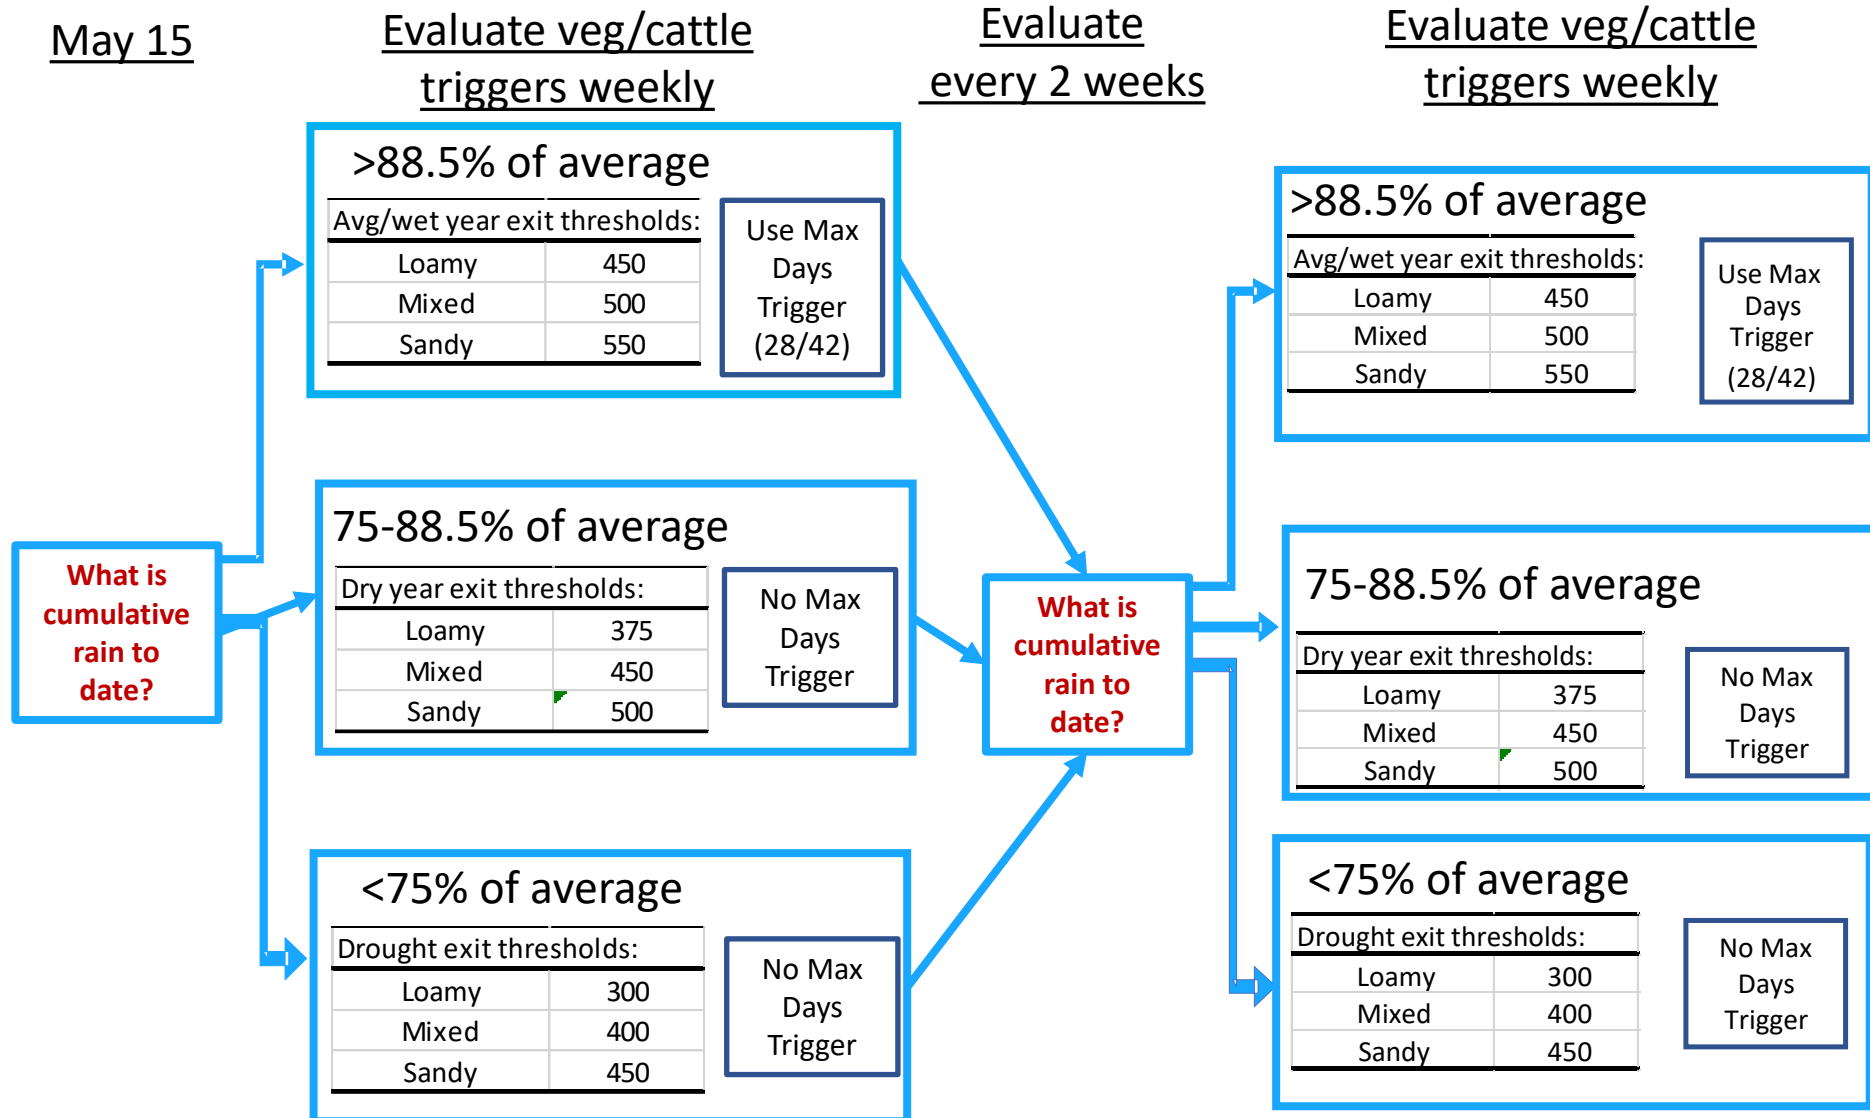

1930's Dust Bowl

Drought Management Plans

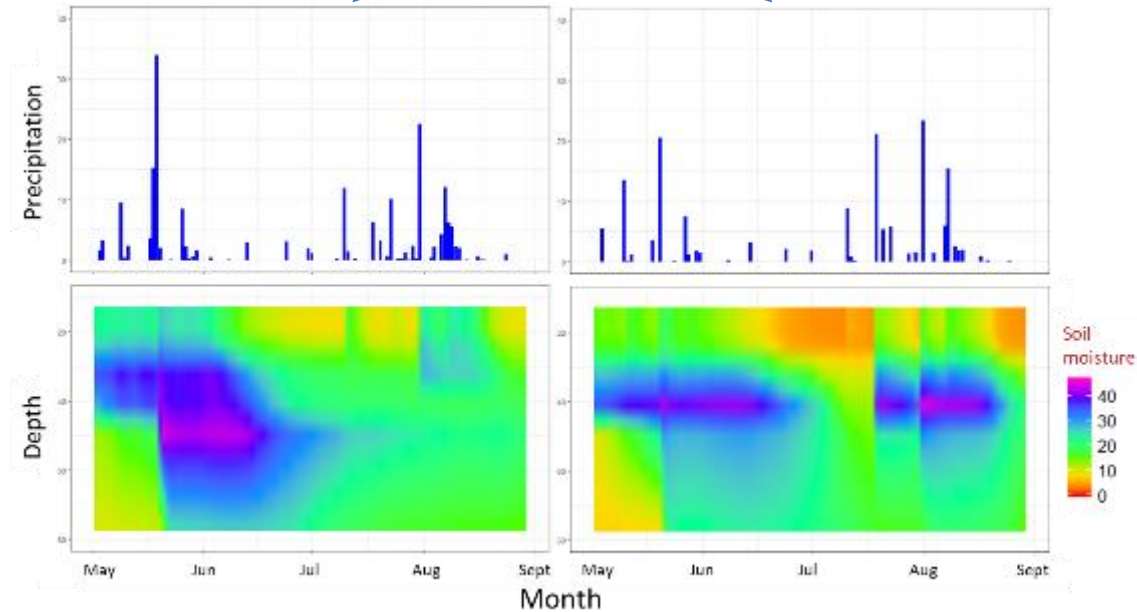

- Adaptive rotation = flexibility
- Rested pastures = "grass banking"
- Defined climate triggers
- Near real time environmental monitoring

Stakeholder-defined **drought triggers**

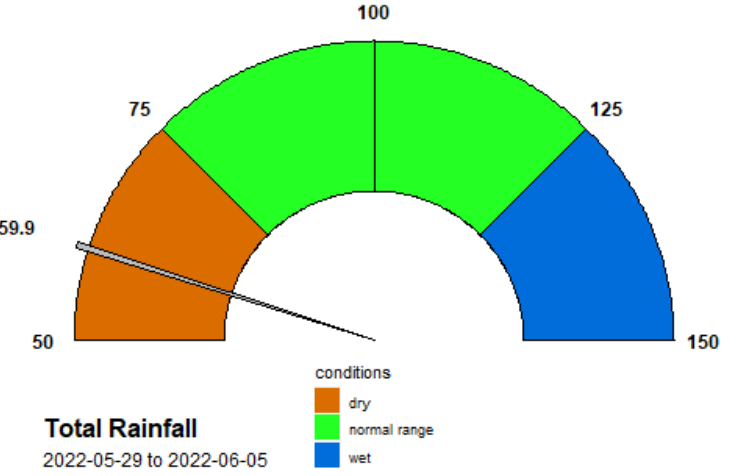

Ground-based **environmental sensors**

Decision support tools to inform adaptive rangeland management

Current precipitation (% historical)

Current soil moisture (%)

Decision support tools to inform adaptive rangeland management

Science-informed **adaptive decision-making**

2022 Drought Management

Scientists

Stakeholders

CARM **Co-production**

Scientists

Rapidly adapt livestock production to changing environmental conditions

Stakeholders

Learned about the patterns and processes driving water variability

Learned how to create user-friendly indicators to enhance decision-making

Thank You
